React Todo List Styles

show me example for good todolist with good sturcture and preformance with good responsive and reusable with example of 1 css 2 scss 3tailwind with react ts

Creating a well-structured, performant, responsive, and reusable to-do list with React and TypeScript, using three different approaches for styling (CSS, SCSS, and Tailwind CSS) can help you understand how to organize your project for maintainability and scalability. Below is an example of how to structure the application with these styling approaches.

1. CSS (Traditional Approach)

Folder structure:

```
css

src/
  ├── components/
  │   ├── TodoList/
  │   │   ├── TodoList.tsx
  │   │   └── TodoList.css
  ├── App.tsx
  └── index.tsx
```

TodoList.tsx

```tsx
import React, { useState } from 'react';
import './TodoList.css';

interface Todo {
  id: number;
  text: string;
  completed: boolean;
}

const TodoList: React.FC = () => {
  const [todos, setTodos] = useState<Todo[]>([]);
  const [newTodo, setNewTodo] = useState<string>('');
```

```
  const addTodo = () => {
    const newTodoItem = { id: Date.now(), text: newTodo, completed: false };
    setTodos([...todos, newTodoItem]);
    setNewTodo('');
  };

  const toggleTodo = (id: number) => {
    setTodos(todos.map(todo => todo.id === id ? { ...todo, completed:
!todo.completed } : todo));
  };

  const removeTodo = (id: number) => {
    setTodos(todos.filter(todo => todo.id !== id));
  };

  return (
    <div className="todo-list">
      <h1>Todo List</h1>
      <input
        type="text"
        value={newTodo}
        onChange={(e) => setNewTodo(e.target.value)}
        placeholder="Add a new task"
      />
      <button onClick={addTodo}>Add</button>
      <ul>
        {todos.map((todo) => (
          <li key={todo.id} className={todo.completed ? 'completed' : ''}>
            <span onClick={() => toggleTodo(todo.id)}>{todo.text}</span>
            <button onClick={() => removeTodo(todo.id)}>Delete</button>
          </li>
        ))}
      </ul>
    </div>
  );
};

export default TodoList;
```

TodoList.css

```
css
```

```css
.todo-list {
  display: flex;
  flex-direction: column;
  align-items: center;
  margin-top: 20px;
}

.todo-list input {
  padding: 10px;
  margin-bottom: 10px;
  width: 200px;
}

.todo-list button {
  padding: 10px 15px;
  margin-bottom: 20px;
  background-color: #007bff;
  color: white;
  border: none;
  cursor: pointer;
}

.todo-list ul {
  list-style-type: none;
  padding: 0;
}

.todo-list li {
  display: flex;
  justify-content: space-between;
  align-items: center;
  width: 300px;
  padding: 10px;
  margin-bottom: 5px;
  background-color: #f9f9f9;
  border: 1px solid #ddd;
}

.todo-list li.completed {
  text-decoration: line-through;
  color: #888;
}
```

```
.todo-list li button {
  background-color: red;
  color: white;
  padding: 5px;
  cursor: pointer;
}
```

---

2. SCSS (Advanced Styling)

Folder structure:

```
css

src/
  ├── components/
  │   ├── TodoList/
  │   │   ├── TodoList.tsx
  │   │   └── TodoList.scss
  ├── App.tsx
  └── index.tsx
```

TodoList.tsx

```
tsx

import React, { useState } from 'react';
import './TodoList.scss';

interface Todo {
  id: number;
  text: string;
  completed: boolean;
}

const TodoList: React.FC = () => {
  const [todos, setTodos] = useState<Todo[]>([]);
  const [newTodo, setNewTodo] = useState<string>('');
```

```
  const addTodo = () => {
    const newTodoItem = { id: Date.now(), text: newTodo, completed: false };
    setTodos([...todos, newTodoItem]);
    setNewTodo('');
  };

  const toggleTodo = (id: number) => {
    setTodos(todos.map(todo => todo.id === id ? { ...todo, completed:
!todo.completed } : todo));
  };

  const removeTodo = (id: number) => {
    setTodos(todos.filter(todo => todo.id !== id));
  };

  return (
    <div className="todo-list">
      <h1>Todo List</h1>
      <input
        type="text"
        value={newTodo}
        onChange={(e) => setNewTodo(e.target.value)}
        placeholder="Add a new task"
      />
      <button onClick={addTodo}>Add</button>
      <ul>
        {todos.map((todo) => (
          <li key={todo.id} className={todo.completed ? 'completed' : ''}>
            <span onClick={() => toggleTodo(todo.id)}>{todo.text}</span>
            <button onClick={() => removeTodo(todo.id)}>Delete</button>
          </li>
        ))}
      </ul>
    </div>
  );
};

export default TodoList;
```

TodoList.scss

```
scss
```

```scss
$primary-color: #007bff;
$completed-color: #888;
$background-color: #f9f9f9;
$button-color: red;

.todo-list {
  display: flex;
  flex-direction: column;
  align-items: center;
  margin-top: 20px;

  input {
    padding: 10px;
    margin-bottom: 10px;
    width: 200px;
  }

  button {
    padding: 10px 15px;
    margin-bottom: 20px;
    background-color: $primary-color;
    color: white;
    border: none;
    cursor: pointer;
  }

  ul {
    list-style-type: none;
    padding: 0;
  }

  li {
    display: flex;
    justify-content: space-between;
    align-items: center;
    width: 300px;
    padding: 10px;
    margin-bottom: 5px;
    background-color: $background-color;
    border: 1px solid #ddd;

    &.completed {
```

```
      text-decoration: line-through;
      color: $completed-color;
    }

    button {
      background-color: $button-color;
      color: white;
      padding: 5px;
      cursor: pointer;
    }
  }
}
```

---

3. Tailwind CSS (Utility-First Approach)

Folder structure:

```
css

src/
  ├── components/
  │   ├── TodoList/
  │   │   ├── TodoList.tsx
  ├── App.tsx
  └── index.tsx
```

TodoList.tsx

```
tsx

import React, { useState } from 'react';

interface Todo {
  id: number;
  text: string;
  completed: boolean;
}

const TodoList: React.FC = () => {
```

```
  const [todos, setTodos] = useState<Todo[]>([]);
  const [newTodo, setNewTodo] = useState<string>('');

  const addTodo = () => {
    const newTodoItem = { id: Date.now(), text: newTodo, completed: false };
    setTodos([...todos, newTodoItem]);
    setNewTodo('');
  };

  const toggleTodo = (id: number) => {
    setTodos(todos.map(todo => todo.id === id ? { ...todo, completed:
!todo.completed } : todo));
  };

  const removeTodo = (id: number) => {
    setTodos(todos.filter(todo => todo.id !== id));
  };

  return (
    <div className="flex flex-col items-center mt-5">
      <h1 className="text-2xl font-bold">Todo List</h1>
      <input
        type="text"
        value={newTodo}
        onChange={(e) => setNewTodo(e.target.value)}
        placeholder="Add a new task"
        className="p-2 mt-2 border border-gray-300 rounded"
      />
      <button onClick={addTodo} className="p-2 mt-2 bg-blue-500 text-white rounded">
        Add
      </button>
      <ul className="list-none p-0">
        {todos.map((todo) => (
          <li
            key={todo.id}
            className={`flex justify-between items-center p-2 mt-2 w-72 bg-gray-100
border ${todo.completed ? 'line-through text-gray-500' : ''}`}
          >
            <span onClick={() => toggleTodo(todo.id)}>{todo.text}</span>
            <button onClick={() => removeTodo(todo.id)} className="p-1 bg-red-500
text-white rounded">
              Delete
```

```
            </button>
          </li>
        ))}
      </ul>
    </div>
  );
};

export default TodoList;
```

Key Features:

- **Responsiveness**: All approaches use flexible layouts (`flexbox`), ensuring that the to-do list is responsive.
- **Reusability**: The components and styling can be reused across different projects.
- **Performance**: Each method is optimized for performance, especially Tailwind CSS, which ensures minimal CSS output.

You can choose any of these approaches based on your preference for styling. Tailwind offers the fastest development speed due to its utility-first nature, while SCSS and CSS allow for more traditional, customized styling.

show all this with good structre and pretty ui and rsponsive for tablet phone and computer with 1 for css 2 for scss and 3 for tailwind full example

Sure! Here's the full example of a to-do list app with good structure, responsive UI for tablet, phone, and computer, and clean, organized styling for each approach (CSS, SCSS, and Tailwind).

Folder Structure:

```
rust
```

```
src/
  ├── components/
  │   ├── TodoList/
  │   │   ├── TodoList.tsx
  │   │   ├── TodoList.css (or TodoList.scss for SCSS or TodoList.tailwind.css for
Tailwind)
  ├── App.tsx
  └── index.tsx
```

---

1. CSS Approach

TodoList.tsx

tsx

```tsx
import React, { useState } from 'react';
import './TodoList.css';

interface Todo {
  id: number;
  text: string;
  completed: boolean;
}

const TodoList: React.FC = () => {
  const [todos, setTodos] = useState<Todo[]>([]);
  const [newTodo, setNewTodo] = useState<string>('');

  const addTodo = () => {
    if (newTodo.trim()) {
      const newTodoItem = { id: Date.now(), text: newTodo, completed: false };
      setTodos([...todos, newTodoItem]);
      setNewTodo('');
    }
  };

  const toggleTodo = (id: number) => {
    setTodos(todos.map(todo => todo.id === id ? { ...todo, completed:
```

```
!todo.completed } : todo));
  };

  const removeTodo = (id: number) => {
    setTodos(todos.filter(todo => todo.id !== id));
  };

  return (
    <div className="todo-list">
      <h1>Todo List</h1>
      <input
        type="text"
        value={newTodo}
        onChange={(e) => setNewTodo(e.target.value)}
        placeholder="Add a new task"
      />
      <button onClick={addTodo}>Add</button>
      <ul>
        {todos.map((todo) => (
          <li key={todo.id} className={todo.completed ? 'completed' : ''}>
            <span onClick={() => toggleTodo(todo.id)}>{todo.text}</span>
            <button onClick={() => removeTodo(todo.id)}>Delete</button>
          </li>
        ))}
      </ul>
    </div>
  );
};

export default TodoList;
```

TodoList.css

```css
.todo-list {
  display: flex;
  flex-direction: column;
  align-items: center;
  margin-top: 20px;
}
```

```css
.todo-list input {
  padding: 10px;
  margin-bottom: 10px;
  width: 100%;
  max-width: 300px;
}

.todo-list button {
  padding: 10px 15px;
  margin-bottom: 20px;
  background-color: #007bff;
  color: white;
  border: none;
  cursor: pointer;
  width: 100%;
  max-width: 100px;
}

.todo-list ul {
  list-style-type: none;
  padding: 0;
  width: 100%;
  max-width: 350px;
}

.todo-list li {
  display: flex;
  justify-content: space-between;
  align-items: center;
  padding: 10px;
  margin-bottom: 5px;
  background-color: #f9f9f9;
  border: 1px solid #ddd;
}

.todo-list li.completed {
  text-decoration: line-through;
  color: #888;
}

.todo-list li button {
  background-color: red;
```

```
  color: white;
  padding: 5px;
  cursor: pointer;
}

@media (max-width: 768px) {
  .todo-list {
    margin-top: 10px;
  }

  .todo-list input,
  .todo-list button {
    width: 80%;
  }
}

@media (max-width: 480px) {
  .todo-list input,
  .todo-list button {
    width: 100%;
  }
}
```

---

2. SCSS Approach

TodoList.tsx

The same `TodoList.tsx` file as in the CSS example.

TodoList.scss

```scss
$primary-color: #007bff;
$completed-color: #888;
$background-color: #f9f9f9;
$button-color: red;

.todo-list {
  display: flex;
```

```
  flex-direction: column;
  align-items: center;
  margin-top: 20px;

  input {
    padding: 10px;
    margin-bottom: 10px;
    width: 100%;
    max-width: 300px;
  }

  button {
    padding: 10px 15px;
    margin-bottom: 20px;
    background-color: $primary-color;
    color: white;
    border: none;
    cursor: pointer;
    width: 100%;
    max-width: 100px;
  }

  ul {
    list-style-type: none;
    padding: 0;
    width: 100%;
    max-width: 350px;
  }

  li {
    display: flex;
    justify-content: space-between;
    align-items: center;
    padding: 10px;
    margin-bottom: 5px;
    background-color: $background-color;
    border: 1px solid #ddd;

    &.completed {
      text-decoration: line-through;
      color: $completed-color;
    }
```

```
    button {
      background-color: $button-color;
      color: white;
      padding: 5px;
      cursor: pointer;
    }
  }
}

@media (max-width: 768px) {
  .todo-list {
    margin-top: 10px;
  }

  .todo-list input,
  .todo-list button {
    width: 80%;
  }
}

@media (max-width: 480px) {
  .todo-list input,
  .todo-list button {
    width: 100%;
  }
}
```

---

3. Tailwind CSS Approach

TodoList.tsx

```tsx
import React, { useState } from 'react';

interface Todo {
  id: number;
  text: string;
```

```
  completed: boolean;
}

const TodoList: React.FC = () => {
  const [todos, setTodos] = useState<Todo[]>([]);
  const [newTodo, setNewTodo] = useState<string>('');

  const addTodo = () => {
    if (newTodo.trim()) {
      const newTodoItem = { id: Date.now(), text: newTodo, completed: false };
      setTodos([...todos, newTodoItem]);
      setNewTodo('');
    }
  };

  const toggleTodo = (id: number) => {
    setTodos(todos.map(todo => todo.id === id ? { ...todo, completed:
!todo.completed } : todo));
  };

  const removeTodo = (id: number) => {
    setTodos(todos.filter(todo => todo.id !== id));
  };

  return (
    <div className="flex flex-col items-center mt-5 max-w-sm mx-auto">
      <h1 className="text-2xl font-bold mb-4">Todo List</h1>
      <input
        type="text"
        value={newTodo}
        onChange={(e) => setNewTodo(e.target.value)}
        placeholder="Add a new task"
        className="p-2 mb-2 w-full border rounded"
      />
      <button onClick={addTodo} className="p-2 mb-4 bg-blue-500 text-white rounded
w-full">
        Add
      </button>
      <ul className="list-none p-0 w-full">
        {todos.map((todo) => (
          <li
            key={todo.id}
```

```
            className={`flex justify-between items-center p-3 mb-2 bg-gray-100
border rounded ${todo.completed ? 'line-through text-gray-500' : ''}`}
          >
            <span onClick={() => toggleTodo(todo.id)} className="cursor-pointer">
{todo.text}</span>
            <button onClick={() => removeTodo(todo.id)} className="p-1 bg-red-500
text-white rounded">
              Delete
            </button>
          </li>
        ))}
      </ul>
    </div>
  );
};

export default TodoList;
```

Tailwind Setup:

- Install Tailwind by following the steps in the Tailwind docs.
- Tailwind works by adding utility classes directly to HTML elements, as shown in the code above.

Key Features & Responsiveness:

- **Responsive**: All approaches are responsive. The `@media` queries in CSS and SCSS ensure proper layout adjustments on mobile devices. In the Tailwind version, the `w-full` and `max-w-sm` classes help make the UI responsive.
- **User-friendly UI**:
  - Large, clickable areas for mobile and tablet devices.
  - Clear call-to-action buttons (`Add` and `Delete`) with intuitive interactions (e.g., toggling completion and deleting tasks).
  - The use of contrasting colors (e.g., blue for the "Add" button and red for "Delete") ensures clarity.

- **Reusability:** The logic for the to-do list is kept simple and reusable, making it easy to modify and extend in the future.

You can try all three examples and see which one fits your project's needs the best.
